Dear Instructor Bohannon,

In this paper I will be explaining why you shouldn't immediately buy the newest part in the market. Buying the newest computer part is not the best option. These reasons are that building your own computer with parts you chose is cheaper and better, new parts become parts of the past very quickly, and your new part will not be compatible with your other old parts, so you will have to buy other new parts.

Sincerely, William Chen

### The Necessity of Buying New Parts

People often go after the latest technology thinking it will improve their performance by a significant amount, the truth is, depending on what part you had before, buying the new part didn't make a huge difference. Buying brand new parts for your computer all the time is just a money pit. When shopping for new parts for your pc, you should be looking for what parts fit your needs and what you can get that's cheaper than the newest part but is still a solid part. In this essay I will be explaining why buying the newest computer part is useless. You should be looking for a cheaper part with similar performance.

First, you should be building your own computer if you'd like to save money, building your own computer is always cheaper than buying a prebuilt one. Looking for parts for your computer is not easy, you must find something that fits your budget but is also a useful part. Buying the most expensive part is not necessary because you are spending money on the latest technology, buy another one will come out in a month. So, you should look for something a little bit cheaper. Buying prebuilt computers are a lot more expensive because the people who do it, do

it professionally and give you warranties and support. However, you can build a computer that has more performance for less money. Building your own computer can increase the life of your computer, plus you can fine tune your parts in the bios. It is also easier to maintain. It is a lot easier to upgrade your PC if you built it yourself rather than having one built by a manufacturer

Buying the newest part is not necessary because, it will become outdated quickly, new computer parts come and go quickly. People develop new technology every day, so you will never have the newest part, unless you've got the money for it. When looking to upgrade your computer, you should be looking around the internet, looking for sales and compare prices from other websites, this is how you will find the best performance for your money. It takes a lot of patience and time, but this is how you save the most money when looking for new parts.

Buying the newest parts isn't always the best option because you might have to buy a whole new set of other parts for your new part to work. If you are buying the newest graphics card for example, you'd have to buy a new power supply and a new motherboard, because your old motherboard most likely can't support the new graphics card and because your old power supply can't handle the extra power from the new graphics card. So, it only just costs more money on top of the expensive new part. This is when your computer just becomes a money pit. Therefore, it is better to buy older parts, because you can find something that both gives you good specs and costs less money and fits into your old parts already inside your computer.

In conclusion, you should invest your money in cheaper parts than the brand-new parts because, building your own computer instead of the best prebuilt computer is cheaper and you'd

possibly get more performance out of it, buying the most recent product of a company is not necessary because they will come out with an even newer one pretty soon, and finally buying the newest part isn't the best option because you must buy more parts for your computer just to make the new part work.
